

Cybersecurity Foundations Activity Write-Up

Name: Flanuel Times Ochieng

Professional Username: flanuelhudson

Focus Areas: Bug Bounty Hunting, Web Application Penetration Testing, Network Penetration Testing

1. Activity Objective

The objective of this activity was to begin building foundational cybersecurity skills through practical learning, technical exploration, and documentation.

2. Tools and Platforms Used

Claude AI was used to assist in generating and refining the portfolio website code. GitHub was used for version control and project hosting. GitHub Pages was used for public deployment of the portfolio website. Git and command-line tools were used for repository management and deployment workflows. HTML and CSS were used for website structure and styling customization.

3. Steps Taken During the Activity

A professional cybersecurity portfolio website was created, customized, uploaded to GitHub, and deployed publicly using GitHub Pages. Git and GitHub workflows were practiced during deployment and version management.

4. Key Cybersecurity Concepts Explored

Ethical hacking fundamentals, vulnerability research, web application security, networking basics, deployment workflows, and technical documentation were explored.

5. Challenges Encountered

Several deployment and Git configuration challenges were encountered and resolved during the project. This improved troubleshooting abilities and strengthened understanding of real-world deployment workflows.

6. What I Learned

This activity strengthened my understanding of portfolio deployment, GitHub workflows, public technical branding, and the importance of documenting cybersecurity learning professionally.

7. Reflection

Building and deploying a live cybersecurity portfolio website helped establish an early-stage professional cybersecurity presence and improved confidence in handling technical workflows.
